UCI Points Optimization Model

An explainable race-opportunity and ProTeam-risk app for `.1` and `.Pro` road racing.

Start Here

What this app does

Ranks `.1` and `.Pro` races as historical UCI points opportunities and adds a separate ProTeam concentration monitor.

What it does not do

It does not forecast exact rider results or tell a team exactly how many points it will score.

Best way to use it

Start with `Recommended Targets`, then use the other tabs for diagnostics, backtesting, and ProTeam risk.

The deeper idea, methods, and math are available in the collapsed explainer below whenever you want the full logic.

> How the model works: idea, methods, and math

Race editions analyzed	Category-aware targets	On 2026 .1/.Pro calendar	Average top-10 payout	Average startlist size
688	174	143	741.6	133

Choose A Workspace Below

Use the workspace selector below to move through the app. Start with `Recommended Targets` if you're new.

- `Recommended Targets` : the best races to target next season, cross-checked against the `2026` calendar.
- `Edition Diagnostics` : inspect one historical race edition and see its payout, field softness, and route-fit context.
- `Backtest & Calibration` : see how the model performs on future years and compare default versus calibrated weights.
- `ProTeam Risk Monitor` : track how concentrated each ProTeam's counted UCI points are across its rider core.
- `Team Calendar EV` : load saved team-season EV artifacts with KPIs, charts, and explainable race detail.
- `Data Sources` : inspect the historical dataset plus the planning, ProTeam, and Team Calendar EV artifacts currently driving the app.

Recommended Targets | Edition Diagnostics | Backtest & Calibration | ProTeam Risk Monitor | Team Calendar EV

Team-season

Unibet Rose Rockets (2026)

View mode

Active schedule

Freshness

EV artifact as of: `2026-04-19`

Calendar scraped: `2026-04-19T10:05:04.350514+00:00`

The summary cards reflect the saved `2026` team-season snapshot. The story charts and tables below follow the current `Active schedule` filter unless a section says otherwise.

Total expected	Actual points known
3420.3	1927.0

Remaining expected	EV gap known
1627.1	+133.8

Secondary facts: Completed expected: 1793.2 | Race count: 77

Weight details for this EV model live in the `How the model works: idea, methods, and math` expander above.

Team Identity

Saved profile context for `Unibet Rose Rockets`.

`Classics + Sprint Opportunist`

Profile confidence

Medium

This profile favors one-day races and sprint-accessible opportunities, with some stage-hunting value but only limited GC emphasis.

These are analyst-set planning defaults, not rider-level forecasts.

The team profile does not change how many points a race is worth in general. It changes how suitable that race looks for the selected team.

> Why this default profile?

Team continuity and top-5 ProTeam view

File-driven next-season top-5 forecast for `2026` using `baseline_n_riders_150`. This section is meant to make the year-to-year team mapping explicit before you trust the forecast.

Next-season top-5 prob.	Current ProTeam rank	Current 150+ riders	Backtest capture
22%	3	5	77%

Only the current team-season row is available here. That usually means the upstream observed continuity window does not extend into this rename chain yet.

Season	Team	Current rank	150+ riders	Next top-5 prob.	Next team
2026	Unibet Rose Rockets	3	5	0.223	nan

Rider breakout outlook

File-driven next-season `150+` rider forecast for `2026` using `baseline_prior_points`. These probabilities come from the imported rider history and are meant to complement the team-level EV view.

Expected 150+ riders	Riders ≥ 50%	Top rider probability
5.8	3	98%

Rider-race planning view

Deterministic race-by-race rider plan for `2026` using the saved Team Calendar EV artifact and the file-driven `baseline_prior_points` rider model. This is a planning lens, not an optimization solver.

Planned races in view	Mean selected rider prob.	Top captain
77	42%	GROENEWEGE…

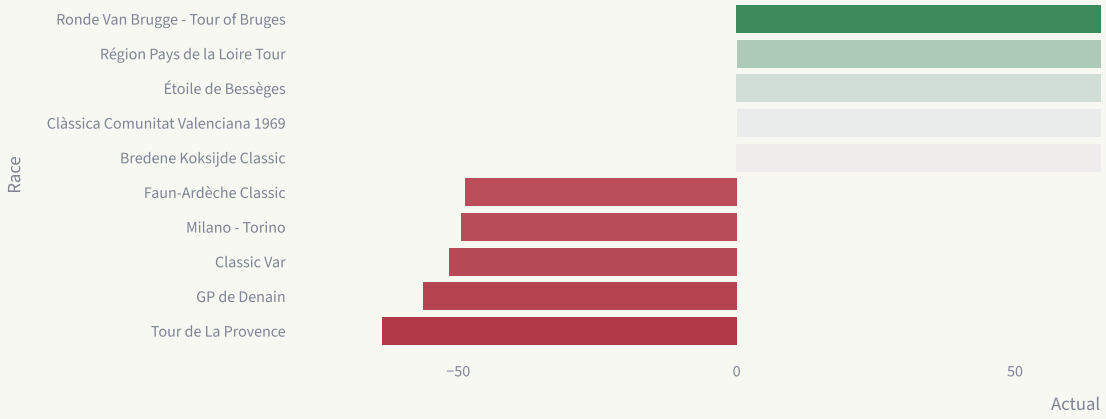
Largest over- and under-expectation races



Race detail

This default table translates the raw EV multipliers into plain-language reads. Use `Team fit read`, `Start confidence`, and `Execution read` to see why the model is optimistic or cautious on each race before you open the analyst grid.

`Strong fit` means the saved team profile matches the race well. `Highly likely` means the start signal is stronger than the planning calendar alone. `Favorable conversion` means the race category is easier to turn into realized points than the biggest, most conservative

events.

Race	Category	Date	Status	Team fit read	Start confidence	Execution read
Classica Camp de Morvedre	1.1	2026-01-23	Completed	Neutral fit (0.83)	Started (0.80)	Favorable conversion (0.4
Gran Premio Castellón	1.1	2026-01-24	Completed	Neutral fit (0.84)	Started (0.80)	Favorable conversion (0.4
Clàssica Comunitat Valenciana 1969	1.1	2026-01-25	Completed	Neutral fit (0.84)	Started (0.80)	Favorable conversion (0.4
Trofeo Calvià	1.1	2026-01-28	Completed	Neutral fit (0.84)	Started (0.80)	Favorable conversion (0.4
Trofeo Ses Salines TTT	1.1	2026-01-29	Completed	Neutral fit (0.83)	Started (0.80)	Favorable conversion (0.4
Trofeo Serra Tramuntana	1.1	2026-01-30	Completed	Neutral fit (0.82)	Started (0.80)	Favorable conversion (0.4
Trofeo Andratx - Pollença	1.1	2026-01-31	Completed	Neutral fit (0.83)	Started (0.80)	Favorable conversion (0.4
GP la Marseillaise	1.1	2026-02-01	Completed	Neutral fit (0.82)	Started (0.80)	Favorable conversion (0.4
Trofeo Palma	1.1	2026-02-01	Completed	Neutral fit (0.83)	Started (0.80)	Favorable conversion (0.4
Étoile de Bessèges	2.1	2026-02-04	Completed	Neutral fit (0.82)	Started (0.80)	Standard conversion (0.30
